examination of the expression of VEGF and other angiogenesis-related adipose tissue of mice. A complex relationship between adipose tissue of mice. A complex relationship between adipose tissue formation or majogenesis and vessel remodelling has been identified. The invention provides methods and compositions for promoting blood vessels in damaged, diseased or transplanted organs, and for producing functional microvascular networks useful in tissue engineering. A method is provided for inducing an immature blood vessel network, or establishment of a functional blood vessel to majorimetring blood vessel remodeling, stabilisation of an immature blood vessel network, lor engineering blood vessel a human. The method involves administering preadlocytes, adipocytes, perivascular cells, vascular smooth muscle cells, mesenchymal precursor cells, mesenchymal cells and fibroblasts, or stem cells that differentiate into these cell types, to a tissue or organ. The method is useful for treating various diseases or disorders e.g. by transplantation of insular transplantation of organ producing thyroid hopping adipocytes, mesenchymal cells is adipocytes, mesenchymal cells for treating endorine transplantation of organ producing thyroid hopping for treating endorine transplantation of organ producing thyroid hopping for treating endorine transplantation of organ producing thyroid hopping for treating endorine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               candidate compound that induce or prevent angiogenesis or vasculogenesis.
                                                                                                                                 Vascular endothelial growth factor; VEGF; blood vessel; angiogenesis; vasculogenesis; transplant; tissue engineering; mouse; PCR; primer; ss

(1) is useful for prognosing and determining the progress stage of 4 synthesis-period of neuroblastoma. The present sequence is a primer, used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                              The present sequence is that of PCR primer AM298-CDSF, which is based on the previously determined amylase gene of Rhizomucor pusillus strain NN101459. AM298-CDSF was used with primer AM298-CDSR AD026323 for the PCR amplification of the alpha-amylase AM782 gene from Rhizomucor pusillus NN046782. A plasmid encoding alpha-amylase AM782 has been transformed into a strain of Escherichia coli DH10B and deposited as DSM 15334. Characterisation of amylase AM782 has shown it to be a highly thermoacidophilic alpha-amylase. It can work at temperatures up to at least 70 degrees C. It also has a very fast reaction speed; when compared at the same dosage with Fungamyl TM3 800 L, the amylase AM782 achieved in about 3 hours hat Fungamyl (24) achieved in 24-48 hours. Amylase AM782
                                                                                                                                                                                                                                                 degrades DP3 into DP2 and DP1. The amplase can be produced by recombinant DNA methods and used for: producing an enzymatically modified starch derivative, desizing textile; bready alcohol production, production of dough products; starch liquefaction and/or saccharification; high maltose
                                          Isolated polynuclectide for, e.g. or making nucleic acid construct used in recombinant expression vector and host cell comprises open reading frame encoding polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Semaphorin; DCSema; human; inflammatory disease; VESPR; interleukin-12;

                                                               This sequence represents a PCR primer for DNA encoding the human semaphorin protein, designated DCSema, of the invention. DCSema is used for treating inflammatory diseases. DCSema ligands bind with VESPR to enhance or promote interleukin-12 (II-12) production which induces an immune response against aggressive micrometastasising tumours. They are associated with immune suppression of mature dendritic cells and therefore can be used for treating autoimmune disorders. They can be employed to measure biological activity of any semaphorin receptor in detecting semaphorin receptor by in vitro assays. DCSema polypeptides are used as reagents in quality assurance studies (to monitor shelf life and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      stability of semaphorin receptor under different conditions). They are also used as a research tool for studying the role of this ligand and its receptor in immune regulation and are also used as carriers for delivering diagnostic or therapeutic agents to cells expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polymorphic variants of colony stimulating factor 1 receptor useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases e.g. inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprising a

maingnant nistrocycosis, myeloid malignancies, and inflammatory discorders and the haplotypes can be used to validate CSFIR as a candidate target for treating a specific condition or disease predicted to be associated to be used in developing disgnostic tests and therapeutic treatments. (I) is useful in studying the expression and function of CSFIR, and in constraints of the variation on the biological activity of CSFIR, and in studying the expression and function of CSFIR, and in the variation on the biological activity and in studying the effect of the variation on the biological activity of CSFIR, Antibodies are useful in a variety of diagnostic and prognostic formats and therapeutic methods. A transgenic animal is useful in studying expression of the CSFIR isogenes in vivo, for in vivo screening and testing of drugs targeted against CSFIR protein, and for testing the efficacy of the cargetic agents and compounds. Allele specific oligonucleotides (ASO) are useful as probes and primers, and for assaying a polymorphism in the target region. Without requiring any apriori knowledge of the phenotypic effect of any particular CSFIR or haplotype the invention provides a method for identifying lead compounds that are more likely to show cefficacy in clinical trials. This sequence is an allele specific oligonucleotide primer used for detecting CSFIR gene polymorphisms, coligonucleotide primer used for detecting CSFIR gene polymorphisms,
malignant histiocytosis, myeloid malignancies, and inflammatory disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 15 BP; 5 A; 4 C; 3 G; 2 T; 0 U; 1 Other;

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 256; 738pp; French.

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour

reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAQ28685-92 are oligonucleotides derived from Erwinia carotovora which can be used to target the pectinase- production related gene, pelA (pectate lyase gene). The oligonuleotides are complementary to the pelA gene. These oligonucleotides can be used to detect foreign genes in transformed vegetables. (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligo:nucleotide for detecting transformant of vegetable - coded by Erwinia carotovora, and targets pectinase-prodn. related gene pectate

AAT50138-T50359 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT50360-750540). CETP is a 74 KD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL) prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically atherosolarosis is familial. The ribozymes can be used to treat conditions associated with apperchalesterolaemia, pripheral vascular disease, dyslipidaemia, hyposlphalipoproteinaemia, vascular complications of diabetes, transplant, atherectory and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lectenosis. By inhibiting CETP, the levels of HDL and low density and extenses in LDL levels, and a corresponding increase in HDL levels. The HT ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes transplant, they have low non-specific
                                                                                                                                                                             Hammerhead ribozyme; cholesterol ester transfer protein; mRNA cleavage; neutral lipid transfer; plasma lipoprotein; atherosclerosis; atherectomy; reverse cholesterol transport; high density lipoprotein; therapy; CETP; familial hypercholesterolaemia; dyslipidaemia; hypoalphalipoproteinaemia; peripheral vascular disease; hyperbetalipoproteinaemia; RCT; inhibitor; angioplastic restenosis; low density lipoprotein; diabetes; HDL; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA -
useful for preventing or treating initial development, progression or
regression of vascular diseases, esp. familial hypercholesterolaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match 0.9%; Score 13.4; DB 1; Length 15; Best Local Similarity 93.3%; Pred. The sequence represents an allele specific oligonucleotide probe for acceptory duals using the Human gene encoding the mi muscarinic acctylcholine receptor, CHMRI. CHMRI is one subtype of a family of 5 genetically distinct muscarinic acctylcholine receptors, mAChR, that play important roles in higher brain function such as learning and memory. The protein is a possible drug target for treatments for Albreimer's disease and antibodies raised against the protein are useful for diagnosing and expression of the gene or activity of the protein, e.g. Alzheimer's description disease and dementia with Lewy bodies
                                                                                                                                                                                                                                                                                                                                                                                                                                New variants of the ml muscarinic acetylcholine receptor gene, useful to find treatment for Alzheimer's and dementia, have single nucleotide variations at one or more of five polymorphic sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense therapy; antiproliferative; antiinflammatory; antipsorfatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor 1 receptor; IGF-1; pityriasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      skin disorders. The method comprises contacting the skin will an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, incoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                      growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for ameliorating the effects of
   IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense oligonucleotide; exon skipping; exon inclusion signal; disease treatment; splice-modulation; gene therapy; dystrophin; haemostatic; antithyroid; muscular; mouse; ss.

                                                                                                                                                                                                                                                                                                                         The present invention relates to a method of decreasing the production of an aberrant protein in a cell containing pre-mRNA of exons coding for the protein, involving providing the cell with an agent capable of specifically inhibiting an exon inclusion signal of one of the exons, and allowing translation of mRNA produced from splicing of pre-mRNA. The new method decreases the production of an aberrant protein in a cell by using a process known as exon-skipping. The process is carried out by providing an agent such as a nucleic acid to inhibit the exon inclusion signal. The nucleic acid agent can therefore be used as a preparation of a medicament for treatment of inherited diseases such as haemophilia A, clotting factor VIII deficiency, some forms of compensation of such an antisense oligonucleotide directed at the murine dystrophin pre-
                                                                                                                                                                                                                             Decreasing the production of an aberrant protein in a cell, for treatmen of inherited diseases such as Duchenne Muscular Dystrophy or Hemophilia, comprises a splice modulation therapy of exons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; platelet-derived growth factor receptor; PDGF-R; cancer;

The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGF=R) is activated in an autocrine manner, inhibits the growth of these cells. The isolated compared to peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys-Lys (PA) hap-Asp-Glu-Glu-Lys (P2) Lys-Leu-Met-Ser-Tyr (P3) Phe-Phe-Phe-Lys (P4) Phe-Phe-His-Pro-Val (P5). (I) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, or habdomyoma-derived cell), lung, breast, collon, prostate, kidney, covary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative cuoding the P5 peptide.
                                                                                              New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genetic marker;

                                                                                                                                This invention relates to a novel method of identifying the presence or absence of a genetic marker in the human cystic fibrosis transmembrane conductance regulator (CFTR) gene of a subject using a PCR sessy. The method comprises providing a DNA sample from the subject, providing at least one primer set given in the specification, contacting the DNA and primer set that comprises a region of bNA that includes the location of the genetic marker, separating the extension product from the at least one the genetic marker, separating the extension product on the basis of marker in the subject by analysing the melting behaviour of the genetic marker in the subject by analysing the melting behaviour of the extension product. The present sequence is that of a PCR primer which was used in the exemplification of the invention.
                                Identifying the presence or absence of a genetic marker in the human cystic fibrosis transmembrane conductance regulator gene of a subject by contacting the DNA and primer set and separating the extension product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying the presence or absence of a genetic marker in the human cystic fibrosis transmembrane conductance regulator gene of a subject by contacting the DNA and primer set and separating the extension product.

This invention relates to a novel method of identifying the presence or absence of a genetic marker in the human cystic fibrosis transmembrane conductance regulator (CFTR) gene of a subject using a PCR assay. The method comprises providing a bNA sample from the subject, providing at least one primer set given in the specification, contacting the DNA and primer set that comprises a region of DNA that includes the location of the genetic marker, separating the extension product on the basis of malting behaviour and identifying the presence or absence of the genetic marker in the subject by analysing the melting behaviour of the extension product. The present sequence is that of a PCR primer which was used in the exemplification of the invention.

Identifying the presence or absence of a genetic marker in the human cystic fibrosis transmembrane conductance regulator gene of a subject by contacting the DNA and primer set and separating the extension product.

Disclosure; SEQ ID NO 477; 154pp; English.

This invention relates to a novel method of identifying the presence or absence of a genetic marker in the human cystic fibrosis transmembrane conductance regulator (CFTR) gene of a subject using a PCR assay. The method comprises providing a DNA sample from the subject, providing at least one primer set given in the specification, contacting the DNA and the primer set, generating an extension product from the at least one primer set that comprises a region of DNA that includes the location of the genetic marker, separating the extension product on the basis of

ö melting behaviour and identifying the presence or absence of the genetic marker in the subject by analysing the malting behaviour of the extension product. The present sequence is that of a PCR primer which was used in the exemplification of the invention. (WDR1), lactotransferrin (LTF), multidrug resistance associated protein 3 (MRP3), orphan nuclear receptor (NR112), or acetylcholine muscarinic receptor 1, 2, 3, 4, or 5 (CHMI), CHMR2, CHMR3, CHMR4 or CHMR5) sequence.

CT the polymorphisms in the human genes cited in the invention are useful as care responsible for specific traits within the genome and eventually identifying the genes responsible for a variety of disorder-related traits as a result of their e.g., overexpression, constitutive and eventually cand/or treating the disorders. The nucleic acid molecules comprising the polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502E1, CYPATAN, CAMPA, MOZO, NRI12, STM, UGT2B4, UGT2B7, UGT2B1, MGT2B1, CMT2B1, CMT2B1 ö NOVX; cardiant; antiarteriosclerotic; hypotensive; cytostatic; anorectic; antidiabetic; immunosuppressive; anti-HIV; neuroprotective; nootropic; antiparkinsonian; antiasthmatic; gynaecological; cardiomyopathy; atherosclerosis; hypotension; cancer; obesity; diabetes; AIDs; multiple sclerosis; graft-versus-host disease; Alzhaimer's; Parkinson's; asthma; fertility disorder; vaccine; gene therapy; chromosome mapping; tissue typing; human; NOV; ss; primer; PCR; RT-PCR. The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, noctropic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, noctropic, antidiabetic, indiagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Albrieimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the RT-PCR primer of the invention which was used to amplify human NOV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              high throughput; CpG methylation; genomic sequence expression; microarray; methylation-silenced gene; demethylation action; cancer cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing or

The invention comprises a high throughput method for assessing genomic CpG methylation and expression of genomic sequences of a tissue sample. The method involves the use of a microarray that has affixed CpG-rich genomic probe fragments each comprising an exon sequence (or portion invention are useful for assessing genomic CpG methylation and expression of genomic sequences of a tissue sample. The method is useful for the identification of novel methylation-silenced genes that are reactivated upon methylation and in determining the efficacy and mechanisms of demechylation and in determining the efficacy and mechanisms of demechylation action in cancer cells. The present DNA sequence represents a PCR primer that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                  Microarray with affixed CpG-rich genomic probe fragments each comprising (a portion of) an exon sequence of an expressible gene, useful in a method for dual assessment of genomic CpG methylation and expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ribozyme; minizyme; cleavage; substrate; hammerhead; DNA arms; helix; ss.

                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                        The target for two half-minizymes KrM1/2A and KrM1/2B is KrS21 (AUUUGCGAGUCCACUGGAG). The target for minizymes M(n)pd, Meg, M(n)t, Mat(6x2) and MUUGC is S13 (GCGGUCAUGAAG). The minizymes have halix II replaced by linkers contg. various numbers of neutral ethyleneglycol (eg) units, charged phosphopropanediol (pd) units, or charged deoxyribothymidine units. A comparison of the cleavage activities of these minizymes against the same substrate allows the optimal number of atoms in the chain linking the two stretches of conserved nucleotides to be determined, and gives some insight into the chemical properties required by the linker. The two half-minizymes together are able to cleave their substrate at the same place as does a hammerhead ribozyme, however, the active struture is very unstable. This indicates that the role of the helix II is to stabilise the active struture. (Updated on 25-

                                                                                                                                                                                                                                            The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGP). A patient (prespicors of vascular endothelial growth factor (VEGP). A patient (prespicors of vascular endothelial growth factor (VEGP). A patient fims-like tyrosine kinase 1 (EL-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (Elk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX7575 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient
Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1;

(preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV9721 to AAV98043 and AAV98979 to AAV99090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV9866 and AAV9866 cand AAV9867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for treating cancers.
                                                                                                                                                                                                                                                                                                 Human, epidermal growth factor receptor, BGFR, BGF-R, target sequence, hammerhead ribozyme, hairpin ribozyme, inhibition, cell proliferation, cancer, genetic drift, detection, mutation, ss.

The present libration describes enzyments activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin alpha 6 subunit gene, an integrin alpha 6 subunit gene, an integrin subunit beta 3 agene, an integrin alpha 6 subunit gene, an integrin subunit beta 3 AAA17167 and AAA17167 and AAA17621 to AAA17684 tepresent their corresponding target sequences; AAA17685 to AAA17685 and AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19255 to AAA19222 represent their corresponding target sequences; AAA19255 to AAA21680 to AAA21500 and AAA19259 to AAA21690 to AAA21690 and AAA21690 to AAA221690 to AAA21690 to AAA221690 to AAA21690 to AAA221690 to AAA221690 to AAA221690 to AAA221690 to AAA22360 to AAA23260 to AAA23342 represent their corresponding target sequences; AAA23342 represent their corresponding target sequences. The ribozyme squences for integrin subunit beta 3, and AAA2340 to AAA23362. AAA3333 to AAA3342 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor especially ARNT, corresponding target sequences. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflammation, and arthritis, as well as enevascular glaucoma, myopic degeneration, psoriasis, verruce vulgaris, and other syndrome, Kippel-Trenaunay Weber spidrome, verruce vulgaris, and other syndrome, wand other syndrome, the level to the lev

```
capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic comprises: (a) introducing into the system a random library of nucleic comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endounclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to clave target nucleic acid, particularly for treating systems, non-hepetic ascites and infection. They may also be used to detect genetic drift and ascites and infection. They may also be used to detect genetic drift and contains in diseased cells and to determine craf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restencests, personned arthritis, or used to treat cancer, restencests with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV99922 to AAV33877 represent NACs that can be used in the activity, AAV99022 to AAV33877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAATI Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; noctropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOG0; hammerhead ribozyme; DNAzyme; inozyme; declarer; amberzyme; inizyme; linozyme; linozyme; non-Hodgkin's lymphoma; NHL; lymphoma; leukaemia; human immunodeficiency virus; HTV associated NHL; mantle-cell lymphoma; MCI; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; cerebrous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; Parkinson's disease; ataxia; Huntington's disease; creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                Ribozyme; erythropoietin; granulocyte colony stimulating factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess set of SNP alleles associated with a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to

Claim 30; Page 142; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cepulates expression of a neutite growth inhibitor gene (NGOD). The regulates expression of a neutite growth inhibitor gene (NGOD). The nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a namberzyme (cleaving RNA with a NYM motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA corporated with a YGY motif). The CD20-targetting nucleic acid as used to cleave RNA corporated patient having a condition associated with the level corporated in the presence of a divalent cation that is preferably Mg<sup>2</sup>2+.

The cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-theixemia, HIV (human immunodeficiency virus) associated NHL, lymphocytic lymphoma, lambor in munodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunodefic acid is used to cleave RNA of the NGOS gene in the erargetting nucleic acid may be contacted with a cell to reduce NGOS activity of the coll and treat a patient having a condition associated with the level of

ö NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenzative disease states which respond to the modulation of NOGO expression. The present Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; mucollar; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; Jecleaver; amberzyme; linzyme; lincyme; Jeckeemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphoma; leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; cerebrous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; cenentherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease. Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury. ```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegulates expression of a neutite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. CT Purhermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more threat lymphoma, leukaemia, B-cell lymphoma, lowerated or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (NHL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cimmune thrombocytopaenia, and inflammatory archropathy. The NOGO gene in the compression of a divalent cation that is preferably Mg² 2+. Furthermore, the comprise of a divalent cation that is preferably Mg² 2+. Furthermore, the comprise the use of one or more coll and treat a patient having a condition associated with the level of the NoGO for the propertion of a divalent cation that is preferably Mg² 2+. Furthermore, the condition appropriate and the level of the propertion of a divalent paying a condition associated with the level of the propertion of the propertion of the propertion of a divalent paying the the use of one or more propertion of a divalent paying the propertion of a divalent paying the propertion of a divalent paying the propertion of the propertion of the propertion of the properti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cerebroprotective; noctropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; d-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin; slymphoma; MHL; lymphocytic leukaemia; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; ampotrophic lateral sclerosis; Parkinson's disease; ataxia; Huntington's disease; creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.

Synthetic

ICAM-1 triple helix associated oligonucleotide SEQ ID 4.

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids (e.g. a ribozyme or a namberzyme (cleaving RNA with an NGN withis) present of cleaving RNA with a NKN motif) presence of a divalent cation that is preferably Mg^2+.

Cof CD20 in the presence of a divalent cation that is preferably Mg^2+.

Cof CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-call lymphoma, low-grade or follicular non-creat lymphoma (MLL), bulky low-grade or follicular non-creat lymphoma (MLL), bulky low-grade or follicular NHL, lymphocytic lymphoma (MLL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma and inflammatory arthropathy of the centeral may further comprise the use of one or more theat centeral nervous sy
                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

This invention describes novel polydeoxyribonucleotides (A), for use as triple-helix forming oligonucleotides, having at least 3 sequential burine and/or pyrimidine bases, capable of inhibiting transcription of ICAM-1. (A) has a sequence specific for the transcribed or promoter regions of the ICAM-1 (intracellular adhesion molecule) gene. The products of the invention have antipsoriatic, dermacological, antiantlammatory, immunosuppressive and gastrointestinal activity. (A) are used for treatment or prevention of ICAM-1-associated diseases, specifically psoriasis, neurodermatitis, allergic asthma. Cronn's disease, autoimmune diseases and transplant rejection. Compared with antisease oligonucleotides, (A) provide a longer-lasting effect (they bind directly to the gene, so a compensatory increase in the provide transplation is not possible). (A) may be coupled to psoralen to provide the provide the series of the point of the point
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            light-regulatable, sequence-specific downregulation of genes; this should make photo-ultra-violet therapy more specific, with reduced side effects.
                                                    ICAM-1; triple helix; transcription inhibition; antipsoriatic; intracellular adhesion molecule; dernatological; antiasthmatic; antiflammatory; immunosuppressive; gastrointestinal; psoriasis; neurodermatitis; allargic asthma; Crohn's disease; autoimmune disease; transplant rejection; psoralen; photo-ultra-violet therapy; ds.

ABN06631 standard; DNA; 17 BP.

Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

WO200192524-A2

06-DEC-2001

Homo sapiens.

Human GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:6623

(first entry)

29-MAY-2002

ABN06631;

```
New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                       Disclosure; SEQ ID NO 10675; 214pp; English.

Shannon ME;

Chen W,

Rank DR,

The present invention describes a human genome-derived myosin-like

protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP
c c can be used in gene therapy and vaccine production. The hGDMLP-1

mucleic acids can be used as probes to detect, characterise and quantify

mucleic acids in samples, as amplification substrates, to

hGDMLP-1 nucleic acids in samples, as amplification substrates, to

provide initial substrates for the recombinant engineering of hGDMLP-1

protein variants having desired phenotypic improvements, and for

expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

crosed as immunospens to raise antibodies that specifically recognise hGDMLP
crosed as immunospens to raise antibodies that specifically recognise hGDMLP
crosed as immunospens to raise antibodies that specific biomolecule

and/or amount specifically of hGDMLP- proteins, as specific biomolecule

and/or amount specifically of hGDMLP- proteins, as specific biomolecule

crospture probes for surface-enhanced laser desorption ionisation, as

therapeutic supplement in patients having specific deficiency in hGDMLP-1

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines or for replacement therapy. The

production, and in vaccines and of hGDMLP-1 in particular heart

and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a

disorder associated with the expression of hGDMLP-1. in particular heart

and skeletal muscle disorders. hGDMLP-1 is of homeone 22.

The present sequence in the exemplification of the present invention. N. B.

The sequence data for this patent did not form art of the printed

specification, but was obtained in electronic format directly from WIPO

c at ftp.wipo.int/pub/published\_pot\_general propertions of the present and proved the present and proved the prese

The protein and polymuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therappeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                 Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1
polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skelettal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser description ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart, muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The invention relates to an oligonuclectide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonuclectide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonuclectide. The chemical modifications of the oligonuclectide. The chemical modifications of the oligonuclectides are useful for more of these modifications. The oligonuclectides are useful for a directing repair or alteration of plant genetic information. The oligonuclectides are particularly useful for creating plants with desired the original value (e.g. altering amino acid content of plants or conferring amino acid content of plants or conferring amino acid one of content of plants or conferring amino acid over production, herbicide resistance, imidazolinone and sulphomylurea herbicide conferring cannow of disease resistance, imidazolinone and sulphomylure herbicide conferring conferring conferring mino acid one to triazine resistance), altered floral content of e.g. increased starch or production of waxy starch), altered floral corphology (e.g. male-sterile plants) or modified fatty acid content of e.g. increased starch or production of waxy starch), altered floral corphology (e.g. male-sterile plants) or modified fatty acid content of e.g. endlocations are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome contenting oligonucleotide of the invention ö nuclease-resistant termini, useful for New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil Gaps ö 0.9%; Score 13.4; DB 1; Length 17; 93.3%; Pred. The invention relates to an oligonuclectide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonuclectide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modification, an LNA modification, two or more consist of o-methyl modification, an LNA modification, two or more phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for configuration repeats or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. glyphosate resistance, imidazolinone and sulphonylurea herbicide resistance, indiazolinone and sulphonylurea herbicide sensitance, conferring amino acid oll production, modified starch production (e.g. increased starch or production, modified starch production (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitete, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome altering oligonucleotide of the invention

Porphyric herbicide resistance genome altering oligonucleotide #16. (first entry) 09-APR-2002

Chromosomal genomic alteration; genome altering oligonucleotide; PCR; ss; o-methyl modification; LNA modification; phosphorothioate linkage; DNA repair; DNA alteration; environmental tolerance; hygromycin-B; ablocic stress tolerance; improved nutritional value; hygromycin-B; amino acid over production; herbicide resistance; glyphosate resistance; imidazollanome herbicide resistance; sulphonylurea herbicide resistance; porphyric herbicide resistance; triazine resistance; modified oil production; modified starch production; waxy starch; altered floral morphology, male-sterile plant; albino mutant; doubdited fatty acid content; reduced palmitate production; albino plant; increased stearate production; reduced linolenic acid production; photosynthetic process. 

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotides are useful for more of these modifications. The Oligonucleotides are useful for a combination of any two or more of these modifications. The Oligonucleotides are useful for cliffordides are particularly useful for creating plants with desired phenotypes, e.g. environmental or ablotic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants or conferring amino acid content of plants or conferring amino acid content of plants or conferring amino acid on the oligonucleotide resistance or triazine resistance, imidazolinone and sulphomylurea herbicide conferring cannot be prophyric herbicide resistance or triazine resistance), altered floral corporation of ways starch), altered floral corporation of plants or modified fatty acid content of e.g. increased starch or production of ways starch), altered floral corporation of plants or modified fatty acid content of e.g. increased starch or production of ways starch), altered floral corporation of wall sequence represents a genome and allosing oligonucleotides are also useful for production analysis of photosynthetic processes. This sequence represents a genome analysis of photosynthetic processes. This sequence represents a genome of altering oligonucleotide of the invention ö New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil Gape ö Length 17; 1, Indels Sequence 17 BP; 3 A; 4 C; 6 G; 4 T; 0 U; 0 Other; Query Match 0.9%; Score 13.4; DB 1;

```
The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications on a terminus, or a combination of any two or more phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for consist of these modifications. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. altering amino acid content of plants acid content (e.g. increased starch or production), herbicide resistance), disease resistance, modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing abbino mutants for the analysis of photosynthetic processes. This sequence represents a genome
                   abiotic stress tolerance; improved nutritional value; hygromycin; primer; amino acid over production; herbicide resistance; glyphosate resistance; imidazolinone herbicide resistance; sulphonylurea herbicide resistance; porphyric herbicide resistance; triazine resistance; modified oil production; modified starch production; waxy starch; modified floral morphology; male-sterile plant; albino mutant; modified fatty acid content; reduced palmitate production; albino plant; increased stearate production; reduced linolenic acid production; photosynthetic process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil

ADB03627 standard; DNA; 17 BP.

RESULT 401 ADB03627/c

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal anignment, at least 80 % identity to the 17 mer sequence, a sequence that hypidizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one production of recombinant polypeptides. Any of the nucleic acid, production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tunnours or cell Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; degeneration, specifically cancer but also Alzhaimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disquests and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies Tumour suppression related human fukutin oligo SEQ ID No 979. 0.9%; Score 13.4; DB 1; Length 17; 13.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is cncoded at chromosome 7q22.1, MD24 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 16p12.3 and MD21, encoded at chromosome 16p12. and MD212, especially mD212, especially more activity of MD23. MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids and also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212, encoded and probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

proteins and their coding sequences: MD23, MD24, MD212. MD23 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212. The nucleic useful in constructing microarrays for measuring gene expression. The probes are useful as therapoutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger procein; MD23; MD24; MD21; MD212; chromosome 7q22.1; carconcoome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                          New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6921.3-22.2, MDZ7 is encoded at chromosome 1691.2 and MDZ12 is encoded at chromosome 1592.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4. MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are protein in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        엄
                                                                                                                                                                                                                                                                               The present interaction tradeces accordingly of Hepatitis C. virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DAZymes. C. inozymes, zinzymes, amberzymes, and enzymes, and enzymes. DAZymes. The nucleic acid decoy molecules and getamers that bind to HBV reverse transcriptase primer sequences, as well are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV COMPOUNDS and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene expression according to the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV pression or minus strand DNAzyme sequences disclosed in the present

                                                                                                                                                        ACC6886), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying a quantifying and/or amplifying nucleic acid, e.g. as one component of sene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine;

                                                                            ó
gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene oflip, in virto as (anti) sense reagents, and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaccuticals for prevention and/or treatment of viral diseases that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                            Cytostatic, virucide, neuroprotective, nootropic, neuroleptic, murine, tumour suppression, tumour reversion, apoptosis, virus resistance, viral disease, tumour, cell degeneration, cancer, Alzheimer's disease,

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, requence that hybridizes under stringent conditions with the nucleotides, requences, or the complement, or corresponding RNA, of the incleotides, remembered and some sequences, or mucleotides as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

virus resistance, transgenic animals, Alzheimer's disease, schizophrenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides or under series or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  suppression or reversion, approais and or viral resistance, to produce recombinant polypetides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them accels containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzeamer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0.9%; Score 13.4; DB 1; Length 17;

The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELPI). The NHELPI nucleic acid molecule, NHELPI polypeptide, an antibody against the protein or its antignen-binding fragment is useful in therapy. The NHELPI nucleic acid molecule, NHELPI polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELPI. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELPI. The NHELPI nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELPI gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gape

The invention relates to a novel isolated nucleic acid that encodes a protein with a chromatin organisation modifier (CHROMO) domain. The polynucleotide of the invention demonstrates cytostatic activity and may be useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCPI (prostate cancer candidate protein 1), such as a tumour, as well as during gene therapy and vaccine production procedures. The current sequence is that of the human PCCPI-related DNA fragment SEQ ID 8-directed probe of the invention. Note: The current sequence is not shown within the specification per se but was retrieved from the Wipoweb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New prostate cancer candidate protein 1 (PCCP1), useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 e.g., tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated nucleic acid that encodes a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein of its antipan-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigan-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                             New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human NHELP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chromatin organisation modifier; CHROMO domain; cytostatic; PCCP1; prostate cancer candidate protein 1; tumour; gene therapy; vaccine; human; ss; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human PCCP1 DNA fragment SEQ ID 8-directed probe - SEQ ID 1981.

protein with a chromatin organisation modifier (CHROMO) domain. The polynucleotide of the invention demonstrates cytostatic activity and may be useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCPI (prostate cancer candidate protein 1), such as a tumour, as well as eduring gene therapy and vaccine production procedures. The current sequence is that of the human PCCPI-related DNA fragment SEQ ID 8-directed probe of the invention. Note: The current sequence is not shown within the specification per se but was retrieved from the WipoWeb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel isolated nucleic acid that encodes a protein with a chromatin organisation modifier (CHROWO) domain. The polynucleotide of the invention demonstrates cytostatic activity and may be useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as sequence is that of the human PCCP1-related DNA fragment SEQ ID 8-directed probe of the invention. Note: The current sequence is not shown within the specification per se but was retrieved from the Wipoweb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New prostate cancer candidate protein 1 (PCCP1), useful for preparing composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 e.g., tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                chromatin organisation modifier, CHROMO domain; cytostatic, PCCP1, prostate cancer candidate protein 1; tumour; gene therapy; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human PCCP1 DNA fragment SEQ ID 8-directed probe - SEQ ID 1983.

in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the covelopment of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in viro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of polypeptides. The invention and/or treatment of viral diseases that are characterised by development of tumours or call degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The invention comprises mucleic acids (e.g. antisense oligonucleotides)

that down regulate the expression or inhibit the function of a receptor

for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (FTGDR),

IkappaB kinase (IKK), or protein kinase FKR. The nucleic acids of the

invention are useful for treating: cerebrovascular accident, central

invention are useful for treating: cerebrovascular accident, central

conervous system (CKS) inflammatory disease (e.g. rheumatoid arthritis,

lymphoma or gliona), inflammatory disease (e.g. rheumatoid arthritis,

restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune

clisease, lupus, multiple sclerosis, transplant/graft rejection,

ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic

conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

cucleic acids of the invention are also useful for down-regulating the

expression of a target gene and as a diagnostic tool to examine genetic

drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       glioma; brain tissue; neoplastic; glioma endothelial marker; GEM; anticancer; antiglioma; immune response; cytostatic; multi-drug sensitive glioma; human; long tag; ss.

The present invention describes a method (M1) for aiding in the diagnosis of glioma. (M1) involves detecting an expression product of at least one gene (I) in a first brain tissue sample (T) supported of being neoplastic, where (I) is chosen from any one of 255 genes (glioma chothelial markers (GEMs)) as given in specification, and comparing the expression of (I) in a second normal brain tissue sample (R), where increased expression of (I) in a second normal brain tissue sample (R), where increased expression of (I) in (T) relative to (R), identifies (T) as likely to be neoplastic. Also described: (1) antibody that specifically binds to a extracellular epitope; (2) antibody that specifically binds to a extracellular epitope; (2) antibody that specifically binds to a extracellular epitope; (2) dentifying (M3) a test compound with the cell which expresses (I), monitoring an expression product of the at least one gene and identifying test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) a test compound with the cell which expresses mRNA of at least one gene; (2) identified by a tag as described above, monitoring mRNA of the gene, and identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M5) at least one gene in a mammal, a protein compound with the cell which expresses mRNA of at least one gene in immune response to glioma involves administering to a mammal, a protein call, (I) have cytostatic activities, and can be used to triager immune centure of alignme in a mammal (M2) is useful for treating multipered by a calling in a mammal (M2) is useful for inducing an immune the analyse of a poince of a poince
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           drug sensitive glioma in a human. (MS) is useful for inducing an immune esponse to a glioma in a mammal who has had a glioma aurgically removed. The present sequence represents a human GEM long tag oligonucleotide, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing glioma by detecting expression product of any one of 255 genes, glioma endothelial markers, in brain tissue sample suspected of being neoplastic, and comparing the expression with expression in normal brain tissue sample.
                                                                                                                                                                                                                                                                                                                   Lattera J, Walter K;

Human ER+ breast cancer differentially expressed sequence #44.

The invention relates to a composition which contains at least one vector (B) containing a nucleic acid (I) associated with breast cancer. The vector (B), also polypeptides (II) encoded by (I), are used for treatment of breast cancer. Arrays based on (I), (II), or their fragments, and (II) specific antibodies (Ab) are used to predict characteristics (e.g. invasiveness or stage) of breast cancer, and (I), or its fragments, are used to modulate characteristics of such cells; to identify breast cancer genes and to detect breast cancer (by detecting polymorphic nucleic acid or its products). The present sequence represents a human ER+ breast cancer differentially expressed sequence. ...... containing nucleic acid associated with breast cancer, useful for treating, diagnosing and characterizing breast cancer, also related polypeptides and antibodies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a
                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mutant cell identification-related mutagenic oligonucleotide SeqID316.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cell identification; oligonucleotide-directed sequence alteration; selectable phenotype; transgenic plant; herbicide resistance; sterile plant; abiotic stress tolerance; albino plant; amino acid production; ss.

This invention relates to a novel method of identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method comprises identifying the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method may be useful for the production of plants with herbicide resistance, male or female sterile plants, abiotic stress tolerance, albino plants or plants with altered amino acid production as well as for use in mammalian cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel method of identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method comprises identifying the desired sequence alteration in cells that have been selected for the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mutant cell identification-related mutagenic oligonucleotide SeqID2383.
                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of a mutagenic oligonucleotide which was used in the exemplification of the invention.

The method comprises identifying the desired sequence alteration in cells that have been selected for the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method may be useful for the production of plants with herbicide resistance, male or female sterile plants, abiotic stress tolerance, albino plants or plants with altered amino acid production as well as for use in mammalian cell lines.
target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method may be useful for the production of plants with herbicide resistance, male or female sterile plants, abiolic stress tolerance, albino plants or plants with altered amino acid production as well as for use in mammalian cell lines. The present sequence is that of a mutagenic oligonucleotide which was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mutant cell identification-related mutagenic oligonucleotide SeqID315.

The method comprises identifying the desired sequence alteration in cells that have been selected for the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method may be useful for the production of plants with herbicide resistance, male or female
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sterile plants, abiotic stress tolerance, albino plants or plants with altered amino acid production as well as for use in mammalian cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                               Mutant cell identification-related mutagenic oligonucleotide SeqID2384.
The present sequence is that of a mutagenic oligonucleotide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present sequence is that of a mutagenic oligonucleotide which was

AAT04567-68 are degenerate probes designed based on AAR80061-62 resp. . The probes are used to identify DNA encoding S-adenosylmethionine synthetase. The DNA is used to transform bacteria to efficiently produce the enzyme. A 5.5 kb Sall DNA fragment contg. this DNA gives fragments of 2.4, 1.7 and 1.4 kb when cleaved with BamHI and fragments of 3.3, 1.0, 0.7 and 0.5 kb when cleaved with Pstl

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an antisense compound (I) up to 30 nucleobases in length, where (I) inhibits expression of daxx (also known as Fas binding protein, dapp for death associated protein, dapp for Bts-1 associated protein). (I) has cytostatic and antiinflammatory activity, and can be used in antisense therapy and as a modulator of daxx. (I) is useful for inhibiting the expression of daxx in therapeutics for the treatment of diseases associated with the expression of daxx in therapeutics for the treatment of diseases associated with the expression of daxx in cumour formation and as research reagent. The present sequence represents an inhibitory human daxx antisense phosphorchioate oligonucleotide which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense compounds capable of modulating expression of daxx useful for diagnosis, prophylaxis and treatment of diseases associated with expression of daxx.
                                                                                                                                                                                                                                                                                                                     Human daxx inhibitory antisense phosphorothioate oligonucleotide SEQ:109.

The present sequence is a primer for the PCR amplification of a nucleic acid sequence encoding an inhibitor of the procease activity of hepatocyte growth factor (HGF) activator (HGFA), which has a molecular weight of about 40 kD when determined by SDS-PAGE. The inhibitor, which was isolated from the human cancer cell line MKN45, can be used as an invitor or in vitro regulatory factor for HGF or HGFA. It can also be used to raise antibodies, useful in kinetic studies of the inhibitor, or as assay standards Example 6; Page 34; 38pp; English.
